### **Sustainable cabinet design from the ground up.**

While the foundation of a table determines its structural integrity, the same can be said of a cabinet's toe kick.

Although laminate cabinets are suitable for dry applications, it becomes a disadvantage when used in high moisture areas, especially where liquid spills can accumulate at the base of cabinets. That is why we do not offer anything but powder coated steel and stainless steel toekicks on our cabinets to ensure your cabinets always have a firm foundation.

**Steel toekicks to avoid the wood problem**
